# Ambiguity of tipping points in the media

# Tipping points definition

- ▶ Rather than just exponential growth, tipping points are associated with unstable equilibriums, bifurcations and phase transitions (all of which may cause exponential growth)
- ▶ Types: direct (i.e. Bandwagon process) and contextual
- ▶ Definition: a point in time where a small change in a system variable modifies the system qualitatively, creating a dramatic effect in its state at some time in the future – not necessarily immediately

# Tipping points in society: origin of the concept

- ▶ Morton Grodzins study in U.S. neighbourhoods
  - He discovered that most of the white families remained in the neighbourhood as long as the comparative number of black families remained very small. But, at a certain point, when too many black families arrived, the remaining white families would move out *en masse* in a process known as **white flight**. He called that moment the "tipping point" [1]

# Agenda

## ▶ Part I: Tipping points in *charging systems*

- 1. Social epidemics (Gladwell [2])
- 2. Dissemination of culture model (Axelrod [3])
- 3. Society as a self-organized critical system (Kron and Grund [4])

## ▶ Part II: Landscapes in *charging systems*

- 4. *Charge landscapes* and *avalanche landscapes*
- 5. Applications of landscapes

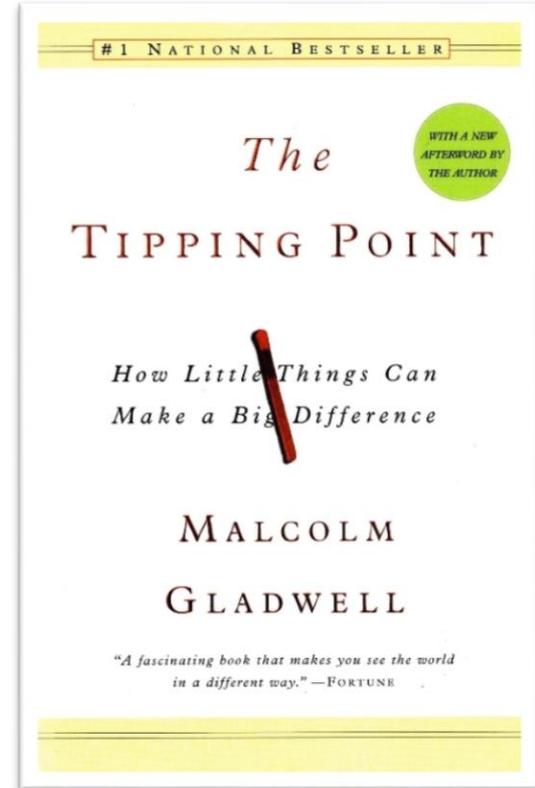

# 1. Social Epidemics

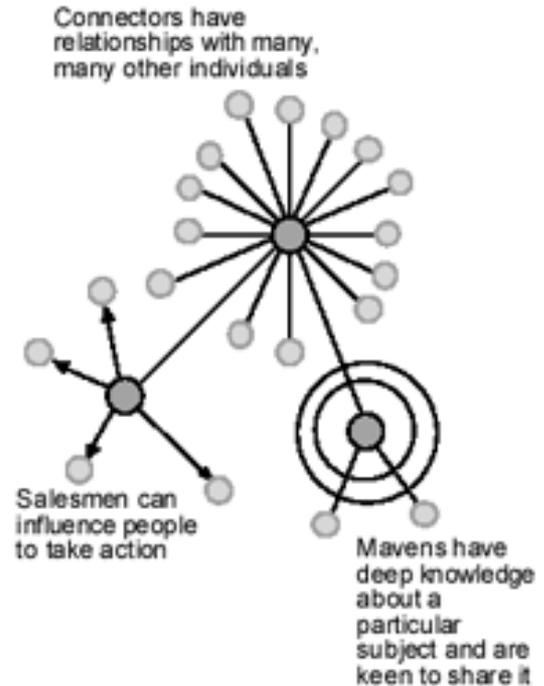

Malcolm Gladwell

NY Times bestseller  
in year 2000

# 1.1 Gladwell's social epidemics rules

- ▶ **People:** The law of the few
  - Mavens, connectors and salesmen
- ▶ **Infection:** The stickiness factor
- ▶ **Environment:** The power of context

## 1.2 Making an ABM model from Gladwell's ideas

Parameters of the model:

▶ **People**

- Number of people, network type, average node degree, percentages and locations of mavens, connectors and salesmen, susceptibility of population

▶ **Infection**

- Stickiness, charge  $th$ , interactions  $th$ , cut-interactions, recover capacity, time of infection, immunity

▶ **Environment**

- Parameters are implicit in the above ones

# 1.3 Programming the model

Control

Setup Go Go once

Network settings

network-type neighbor  
average-node-degree 6  
\*Just for neigh. network

number-of-people 195

more-maven 0.10 more-salesmen 0.65

Mouse-select role-select 3  
1. Maven  
2. Connector  
3. Salesman  
4. Normal

Social epidemic settings

stickiness 0.8 susceptibility 0.7

On recover? infect-time 30 On immunity?

charge-thresh 3

On cut-interactions? interactions-thr... 10

Time: 3D

Percentage adopters/infected

Adopters 10

Time 0 10

Degree distribution

Nodes 10

Degree 0 10

log-log degree distribution

log(# of nodes) 0.3

log(degree) 0 0.3

+ Mavens Connectors Salesman Normal Infected/Adopters Immune Reject

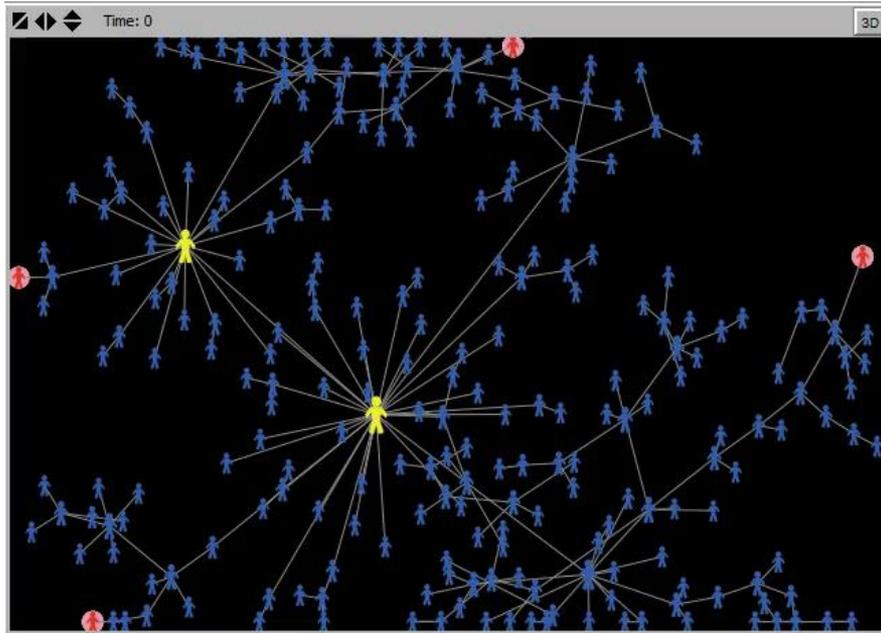

RECORDED WITH SCREENCAST MATIC

## 1.4 Case: Hush puppies (Law of the few)

▶ “Hollywood” network type

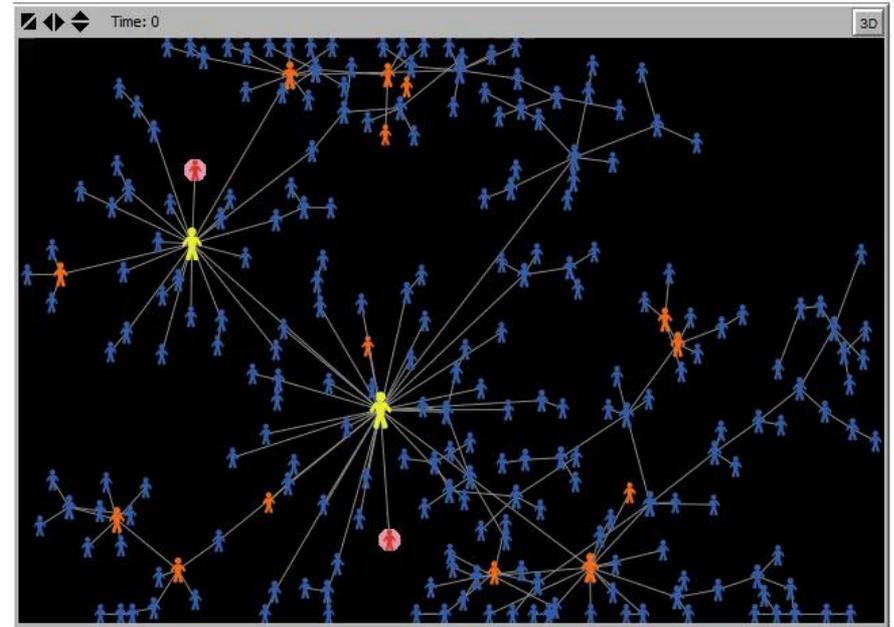

# 1.4 Case: Hush puppies (law of the few)

Mavens Connectors Salesman Normal Infected/Adopters Immune Reject

RECORDED WITH  
SCREENCAST MATIC

Mavens Connectors Salesman Normal Infected/Adopters Immune Reject

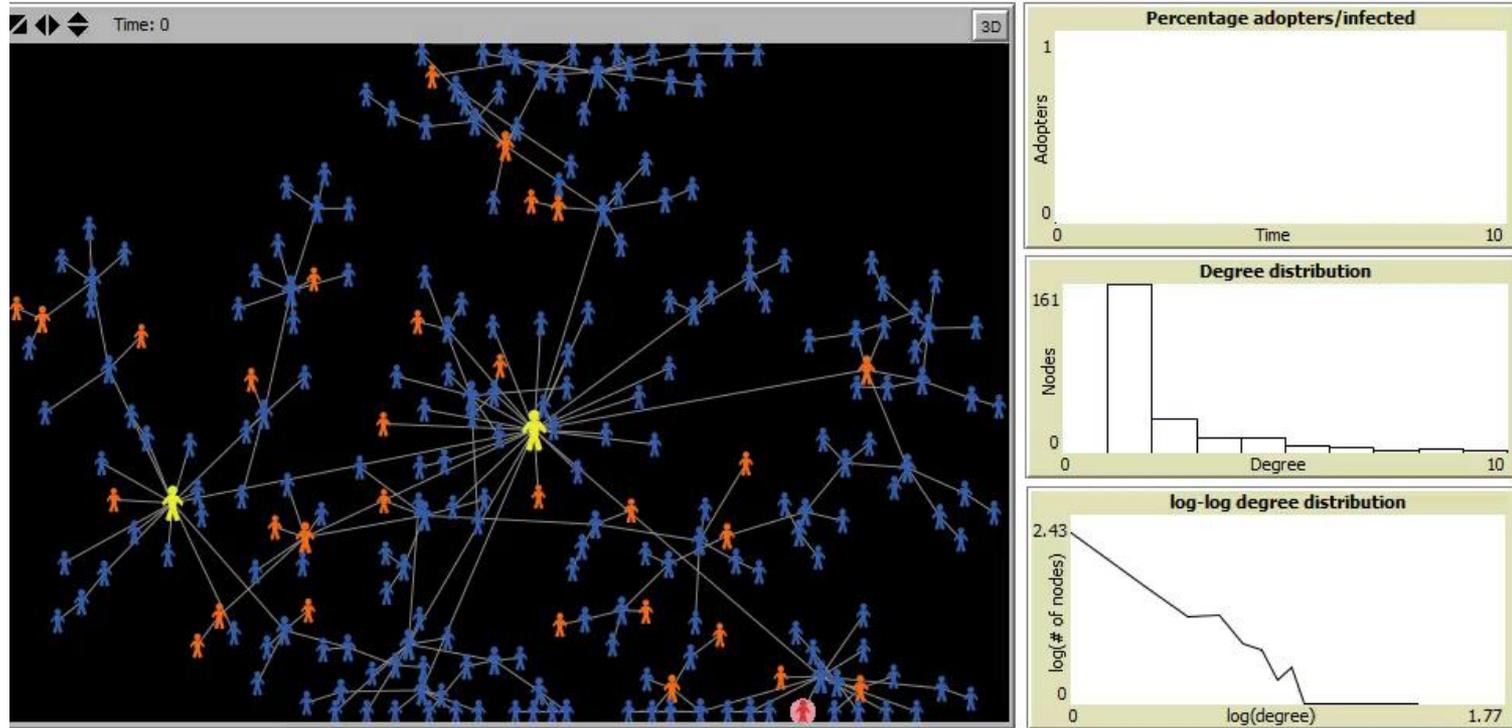

RECORDED WITH  
SCREENCAST MATIC

## 1.5 Case: Sesame street and C-C (stickiness factor)

# 1.5 Case: Sesame street and C-C (stickiness factor)

Mavens Connectors Salesman Normal Infected/Adopters Immune Reject

RECORDED WITH

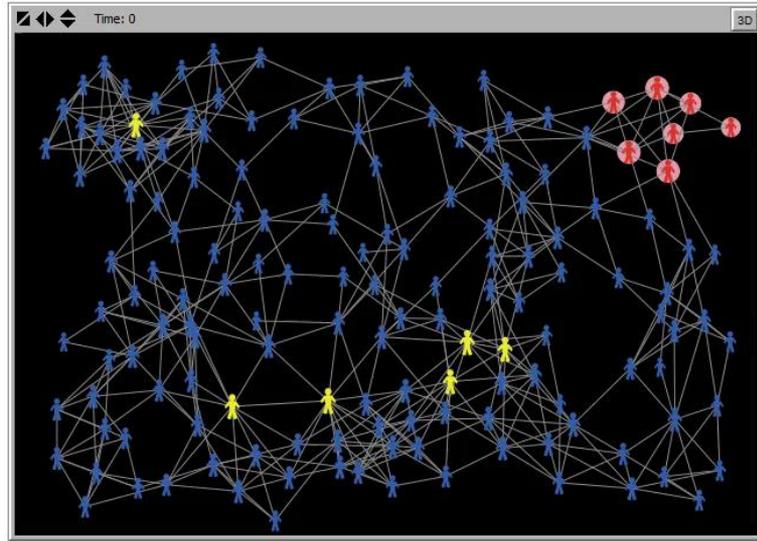

SCREENCAST MATIC

## 1.6 Case: Syphilis in Baltimore (power of context)

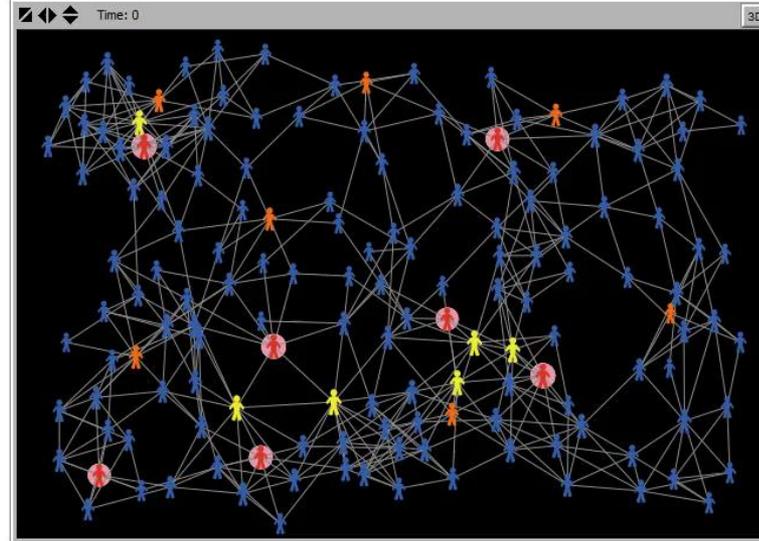

- ▶ 3 little causes
  - Less doctors
  - More drugs → more sex
  - Displaced people

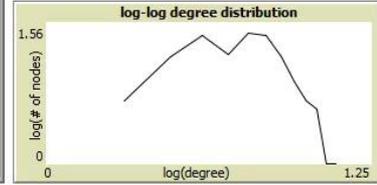

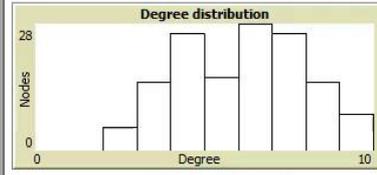

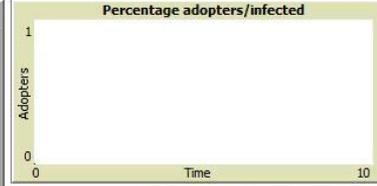

# 1.6 Case: Syphilis in Baltimore (power of context)

RECORDED WITH SCREENCAST MATIC  
Movers Connectors Salesman Normal Infected/Adopters Immune Reject

RECORDED WITH SCREENCAST MATIC  
Movers Connectors Salesman Normal Infected/Adopters Immune Reject

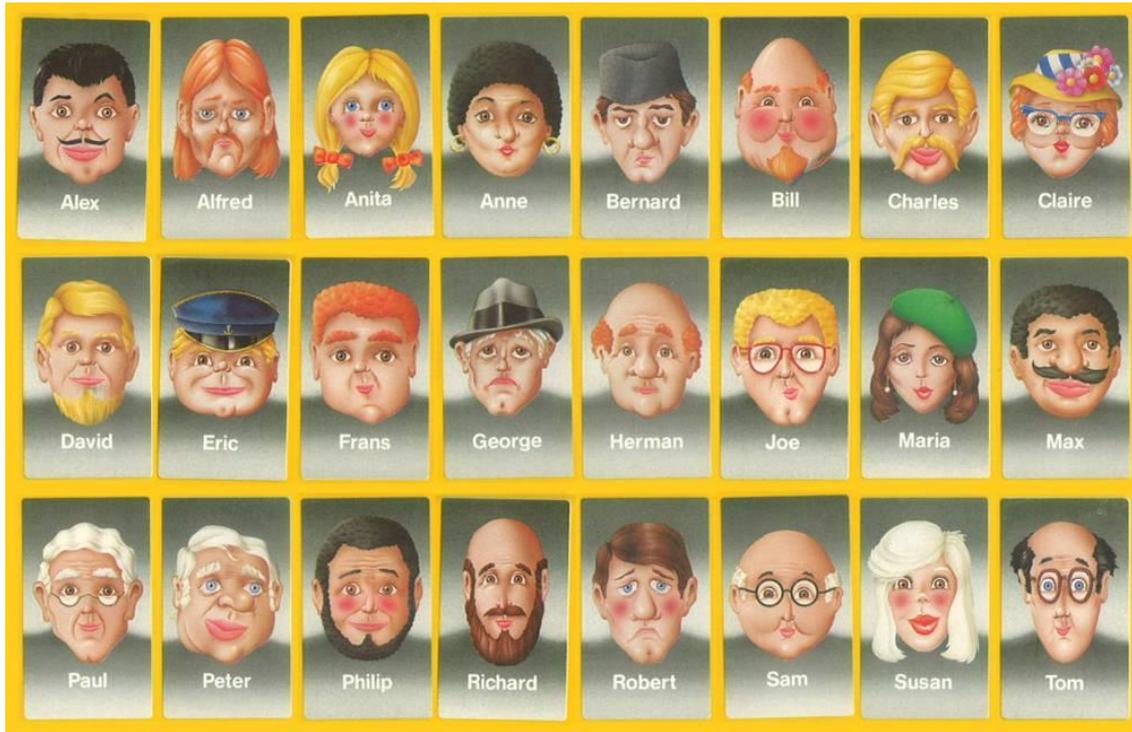

## 2. Axelrod model of dissemination of culture

- ▶ Paper: “The Dissemination of Culture: a model with local convergence and global polarization”, by Axelrod [3]
- ▶ Axelrod: “If people tend to become more alike in their beliefs, attitudes and behaviour when they interact, why do not all such differences eventually disappear?”
- ▶ So he created a model to explain the above question based on the following two premises
  - 1. People are more likely to interact with others who share many of their cultural attributes
  - 2. Interactions between two people tend to increase the number of attributes they share

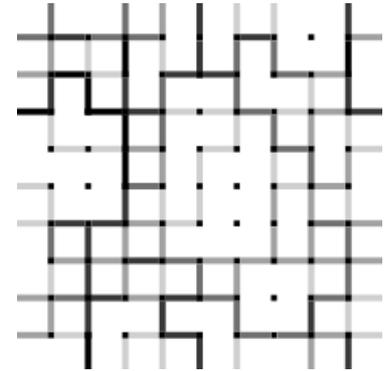

# 2.1 Defining the model

**F features**  
**T attributes**

$X_1$  Mandarin, German, Hindi...  
 $X_2$  Football, swimming, curling...  
 $X_3$  Windows, Linux, Mac...  
:  
 $X_F$  Jazz, reguetón, thrash metal...

## 2.2 Observing average number of stable regions

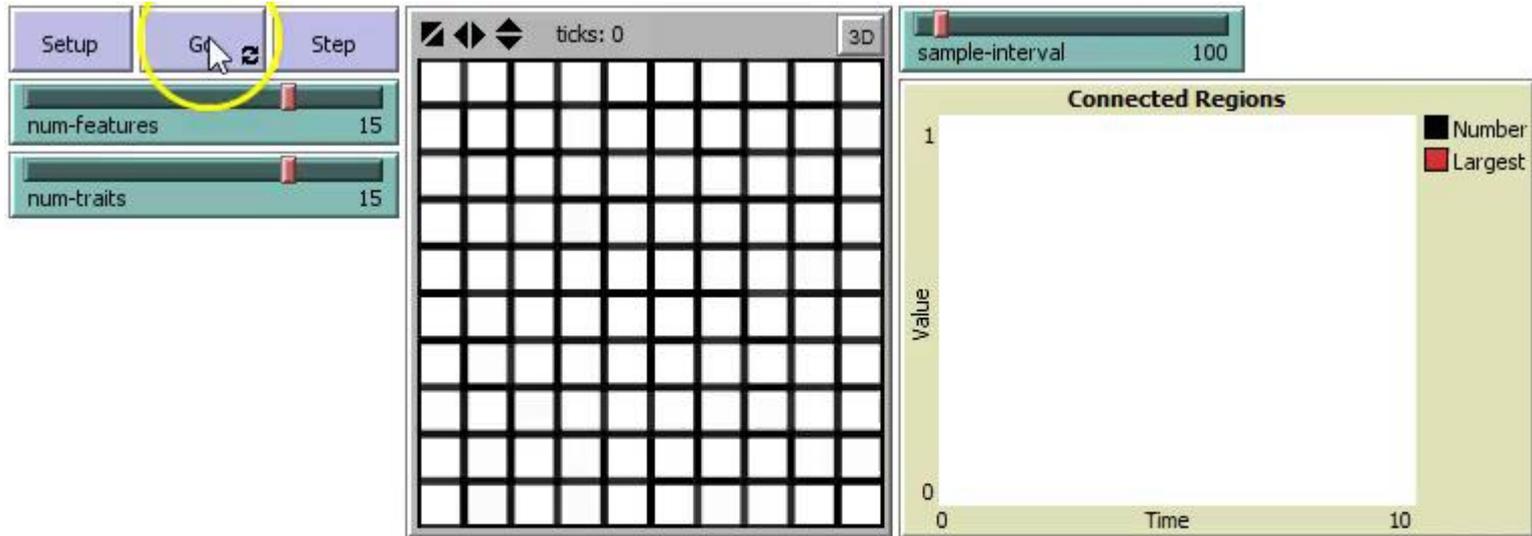

Average Number of Stable Regions

| <i>Number of Cultural Features</i> | <i>Traits per Feature</i> |           |           |
|------------------------------------|---------------------------|-----------|-----------|
|                                    | <i>5</i>                  | <i>10</i> | <i>15</i> |
| 5                                  | 1.0                       | 3.2       | 20.0      |
| 10                                 | 1.0                       | 1.0       | 1.4       |
| 15                                 | 1.0                       | 1.0       | 1.2       |

NOTE: These runs were done with a territory of  $10 \times 10$  sites, and each interior site had four neighbors. Each condition was run 10 times.

## 2.3 Running the model

# 3. Self-organized criticality

- ▶ Paper: “Society as a Self-Organized Critical System” by Kron and Grund [4]
- ▶ Quotes from the paper:
  - Modern society can be seen as a self-organized critical system that endogenously reaches critical states. Small or large breakdowns can be caused by single events
  - The model of self-organized criticality can be used to show how the permanent addition of energy (political power) to a close coupled system (of nations) can result in positive feedback loops. Doing so, we can explain how a single “historical grain of sand” (the assassination in Sarajevo of Archduke Franz Ferdinand) was able to trigger an apocalyptic “avalanche of warlike actions” with more casualties than ever before

# 3.1 Sand-pile model

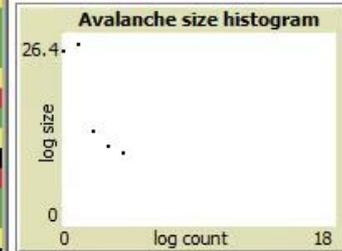

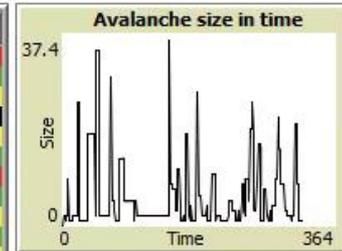

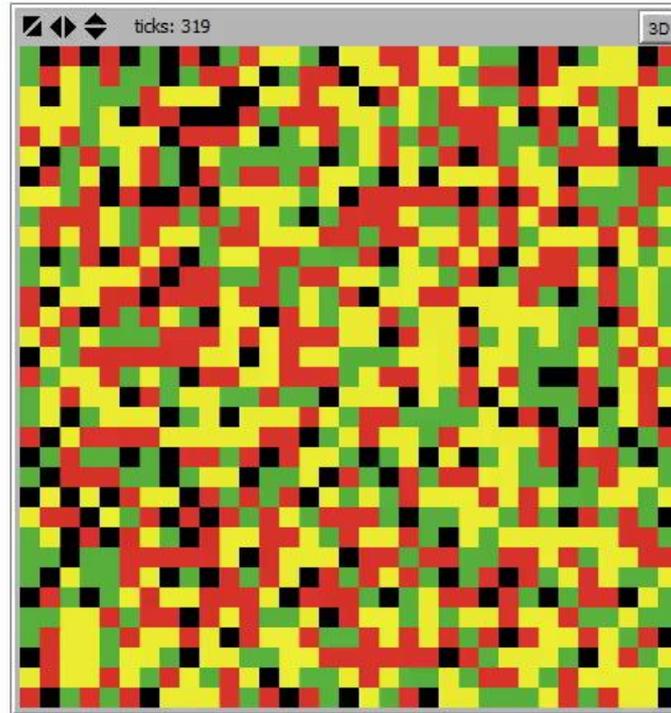

Control panel for the sand-pile model simulation:

- setup-random
- setup-uniform 3
- setup-uniform 0
- drop-location: random
- animate-avalanches? (On/Off)

Simulation controls:

- go
- go

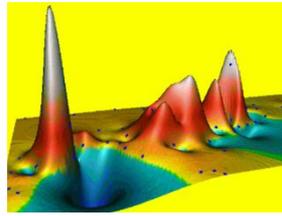

clear size data

## 3.2 Self-organized criticality in society

- ▶ More quotes from the paper:
  - The pile self-organizes and builds up an increasingly complex structure. At some point all non-disruptive locations that do not cause the collapse of the system are occupied (the system is over-critical)
  - We do not need an explanation for how the single historical event of the assassination resulted in WWI, but we need a macro-sociological explanation for the **critical state** that made such a series of events possible (*avalanche landscape*)

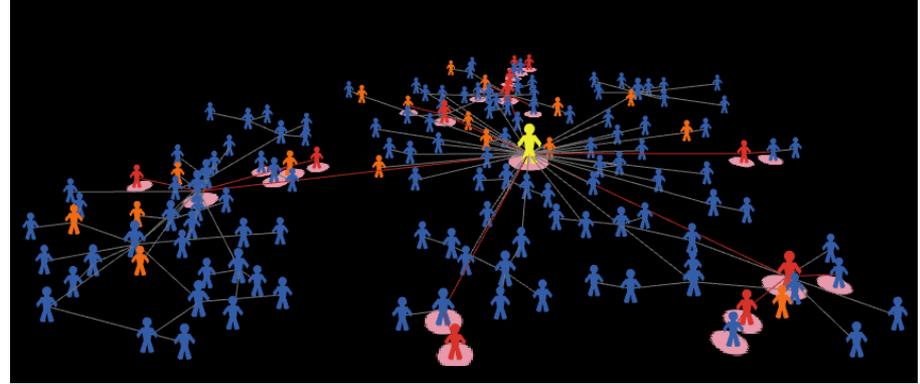

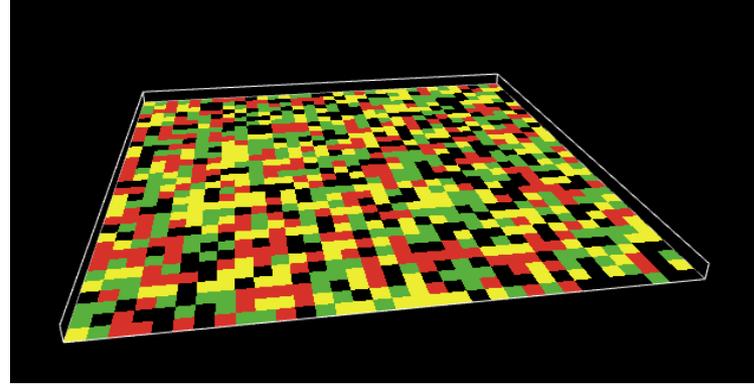

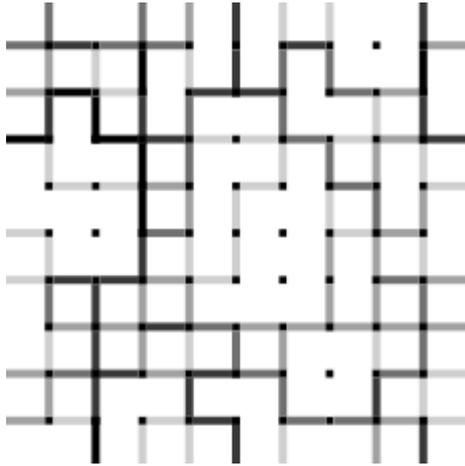

# 4. Charge and avalanche landscapes

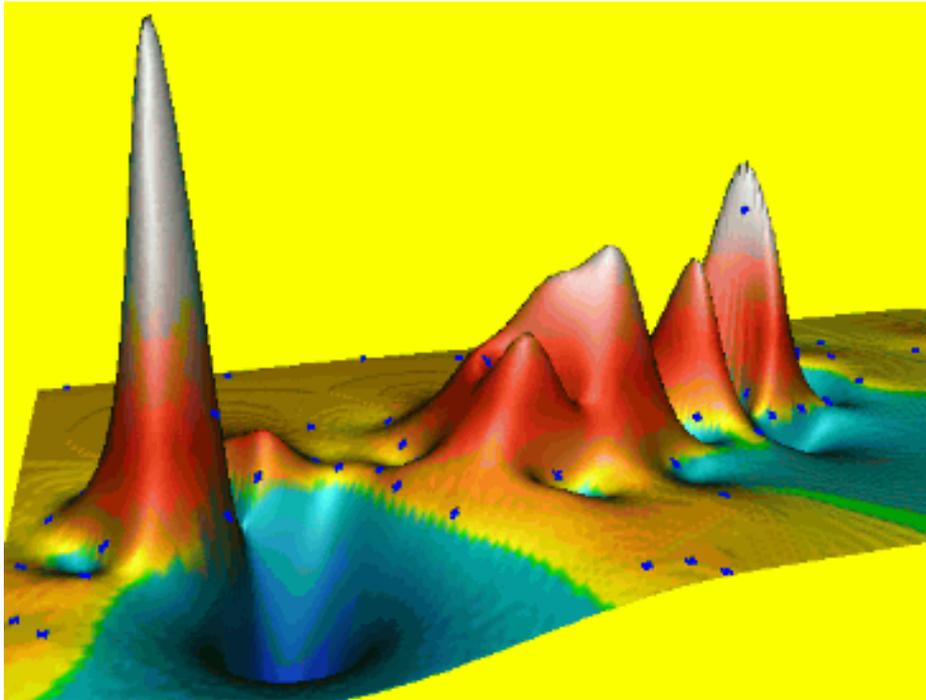

- ▶ What the 3 examples given have in common?
  - A global contextual tipping point makes the system to begin charging. Then small changes (direct tipping points) cause avalanches through charged elements
  - When things seem to be stable they may be not, perhaps a hidden tipping point happened that made the system to begin charging and then a small change can cause an avalanche
- ▶ Landscapes
  - Landscapes are ‘kind of’ a simple way of studying the **GlobalContextualTippingPoint→SystemCharging→DirectLocalTippingPointAvalanche(s)** phenomena in networked and spatial systems
  - *Charge landscapes* can be made and used to create *avalanche landscapes*. Then *avalanche landscapes* can be used to get a general overview of the potential avalanches in order to attenuate or amplify avalanches

# 4.1 Charge landscapes

## 4.2 Avalanche landscapes

- ▶ For deterministic systems, calculate or estimate sizes of avalanches in *charge landscape*. For stochastic systems, calculate or estimate expected values of avalanche sizes
- ▶ Great visual tools for explaining tipping points to non-technical audiences

# 5. Applications of landscapes

- ▶ Applications of landscapes in networked systems:
  - Networks of people: fashion, digital marketing, infectious diseases, riots (i.e. Arab Spring)
  - Networks of organizations: state creation, transnational integration, wars, financial crisis
- ▶ Applications of landscapes in spatial systems:
  - Development: one variable can make a tipping point in other
  - Urban planning: urban racial segregation (Schelling model)
  - Behavioural economics nudges: create simple policies (tipping points) that make big change in society (i.e theory of broken windows)
